

CS177 Python Programming

Recitation 7
Loops, Debugging

Agenda

- Revisit Loops.
- What are computer bugs?
- When are computer bugs discovered?
 - Compile Time and Runtime
- What kind of bugs are discovered?
 - Syntax, Arithmetic and Logic Errors
- Are there tools to help us find bugs?
 - Print statements and Python debugger

For Loop

- Definite Loops are implemented with for loops
- *For* loops are traditionally used when you have a piece of code which you want to repeat *a fixed* number of times.
- The general form of for loop:
For <var> in <sequence>:
 <body>
- *var* is called the loop index, it takes consecutive values listed in *sequence*.
- There are two forms of for loop
 - **for i in range(INTEGER)**
 - **for item in (LIST/STRING)**

For Loop

| | |
|--|--|
| <pre>myList = range(3) for i in myList: print(i) >> 0 1 2</pre> | <pre>for i in range(3): print(i) >> 0 1 2</pre> |
| <pre>str = 'Hello' for c in str: print(c) >> H e l l o</pre> | <pre>str = 'Hello' for i in range(len(str)): print(str(i)) >> H e l l o</pre> |

While Loop

- The general form of a `while` loop:
`while <condition>:`
 `<body>`
- The *condition* is a Boolean expression.
- The `while` will keep looping executing the *body* as long as the *condition* is `True`.

While Loop

- To prevent an infinite loop, the condition of the loop must depend on the body, so that after looping couple of times the condition will be evaluated to **False** and the loop would terminate.

| | |
|--|--|
| <ul style="list-style-type: none">• Infinite loop <pre>i = 0 while True: i = i + 1 print (i)</pre> <p>>> 1 2 3 . .</p> | <ul style="list-style-type: none">• Not infinite loop <pre>i = 0 while i<5: i = i + 1 print (i)</pre> <p>>> 1 2 3 4 5</p> |
|--|--|

Break & Continue

- Break terminates the loop
- Continue terminates the current iteration

```
xlist = [2,4,-1,8]
for num in xlist:
    if (num <0):
        break
    print (num)
```

```
>>
2
4
```

```
xlist = [2,4,-1,8]
for num in xlist:
    if (num <0):
        continue
    print (num)
```

```
>>
2
4
8
```

Nested Loops

- We can define a loop within another loop.
- Each single iteration for the outer loop, all the iterations of the inner loop will be executed.

```
for i in range(4):           #The outer loop
    for j in range(2):      #The inner loop
        print (i,j)
```

```
>>
00
01
10
11
20
21
30
31
```

- The number of times the print statement is executed = $\text{len}(\text{range}(4)) * \text{len}(\text{range}(2))$

Nested Loops

Nested loops are suitable when working with nested lists.
E.g. Given a nested list, print the sum of each inner list.

```
def main():  
    myList = [[1,2,3],[10,-5,20],[40]]  
    for lst in myList:  
        sum = 0  
        for number in lst:  
            sum = sum + number  
        print (sum)
```

```
main()
```

```
>>
```

```
6
```

```
30
```

```
40
```

Nested Loops

Given a nested list, add all positive numbers per inner list and print the sum.

```
def main():
    myList = [[1,2,3],[10,-5,20],[40]]
    for lst in myList:
        sum = 0
        for number in lst:
            if(number < 0):
                continue
            sum = sum + number
        print (sum)
```

main()

>> CORRECT

6

30

40

```
def main():
    myList = [[1,2,3],[10,-5,20],[40]]
    for lst in myList:
        sum = 0
        for number in lst:
            if(number < 0):
                break
            sum = sum + number
        print (sum)
```

main()

>> WRONG

6

10

40

Debugging

Early computers used vacuum tubes. The tubes would get hot and attracted moths. A moth was zapped and interfered with the circuitry. The bug had to be removed to fix the computer. Some say this is how the word “debugging” came into use.

Debugging

- What is a computer bug?
 - A computer bug is a problem that causes a computer to produce an incorrect or unexpected result.

Debugging

- Computer bugs can manifest themselves at different phases of the program execution including:
 - Compile Time (Easy to catch)
 - Runtime (Harder to catch)

When Are Bugs Discovered?

Compile Time, Load Time, & Runtime
Bugs

Compile Time Bug

- Compile time bugs show up when the source code is converted into computer code
- A common compile time error is:
 - Syntax Error
- A syntax error means that the source code does not meet the source code specification.
For example:
 - Missing a ':' at the end of you def statement

Compile Time Bug Example

```
>>> def t2 ()
```

```
SyntaxError: invalid syntax
```

- Notice the missing ':'
- When you run this statement, Python immediately knows that it is invalid code.

Load Time Bug

- Load time bugs, in the context of Python, often have to do with the libraries that are imported
 - The permissions may not be set correctly on an imported library file
 - The library file may not be found

Load Time Bug Example

```
>>> import foo
```

```
ImportError: No module named foo
```

- In this case a library named foo does not exist

Runtime Bug

- Runtime bugs show up when the code is executed
- A common runtime error is:
 - NameError
- A name error means that a function or variable was used that wasn't defined

Runtime Bug Example

```
def t1():  
    print(a)
```

```
>>> t1()
```

- Notice that the variable 'a' is not defined
- When you save the file, Python does not report an error, but when you call the function an error pops up.

Runtime Bug Example

```
def t1():  
    print(a)
```

```
>>> t1()
```

```
NameError: global name 'a' is  
not defined
```

- The NameError is produced when the t1 function is called

What are Some Common Bugs?

Syntax, Arithmetic, and Logic Errors

Syntax Bugs

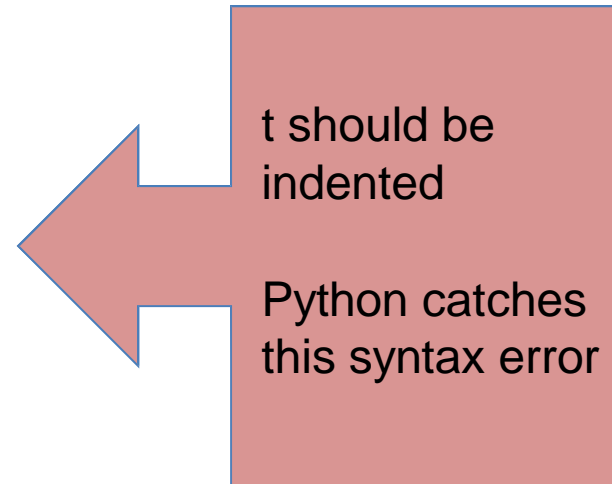

- Syntax errors are often discovered by Python at compile time but not always
- Likely you have encountered many of these:
 - Incorrect indentation
 - Missing elements (like ':')

Syntax Bug

- Incorrect indentation:

```
def t1():  
t = 1
```

Invalid syntax

Syntax Bug

- Missing colon:

```
>>> def t1 ()
```

```
SyntaxError: invalid syntax
```

Arithmetic Bugs

- We will only focus on one, but a few more exist.
- One important arithmetic bug is a divide-by-zero error
 - By definition of division, you can't divide by zero

Arithmetic Bug

- Division by zero:

```
>>> 4/0
```

```
ZeroDivisionError: int division  
or modulo by zero
```

you can't divide by 0

Python will catch this
arithmetic error

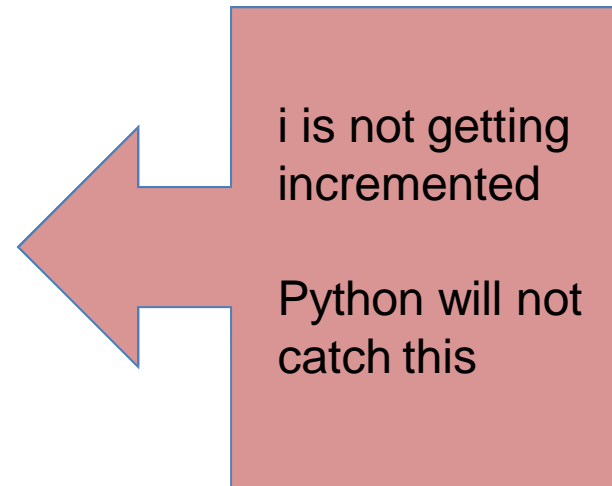

Logic Bugs

- Logic bugs are usually not caught automatically by the computer like Syntax Errors or Name Errors.
- The bug may be subtle and manifest itself in peculiar ways.
- Usually takes human source code analysis to track down the bug

Logic Bug

- Infinite loop:

```
i = 0
while (i < 5) :
    i = 1
```

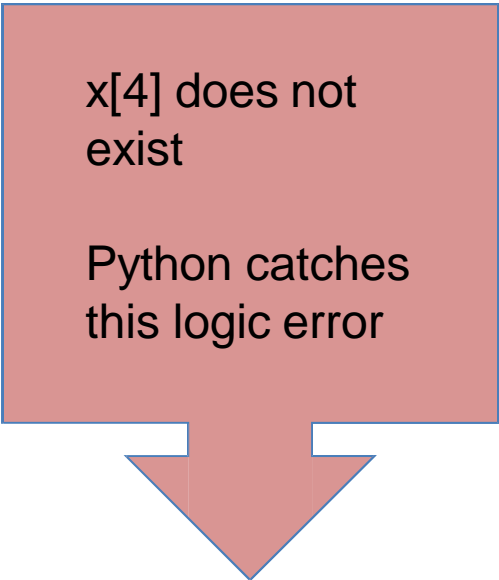

Logic Bug

- Off-by-one error

```
x = [21, 22, 23, 24]
i = 0
while i <= len(x) :
    s = s + x[i]
    i = i + 1
```

IndexError: list index out of range

x[4] does not exist

Python catches this logic error

Find the bug ?!

```
a = 3
if (a=2):
    print(a)
```

a=2
is a syntax error
should be:
a==2

```
>>Traceback (most recent call last):
  File "python", line 2
    if(a=2):
```

Find the bug ?!

This program should add the numbers in a list.

```
def add(a,b):  
    a=a+b  
def main():  
    myList = [5,4,3]  
    sum = 0  
    for i in myList:  
        add(sum,myList[i])  
    print(sum)  
main()
```

Should be add(sum,i)
since i takes values: 5,4,3
there is no myList[5]

>>IndexError: list index out of range

Find the bug ?!

```
def add(a,b):  
    a=a+b  
def main():  
    myList = [5,4,3]  
    sum = 0  
    for i in myList:  
        add(sum,i)  
    print(sum)  
main()
```

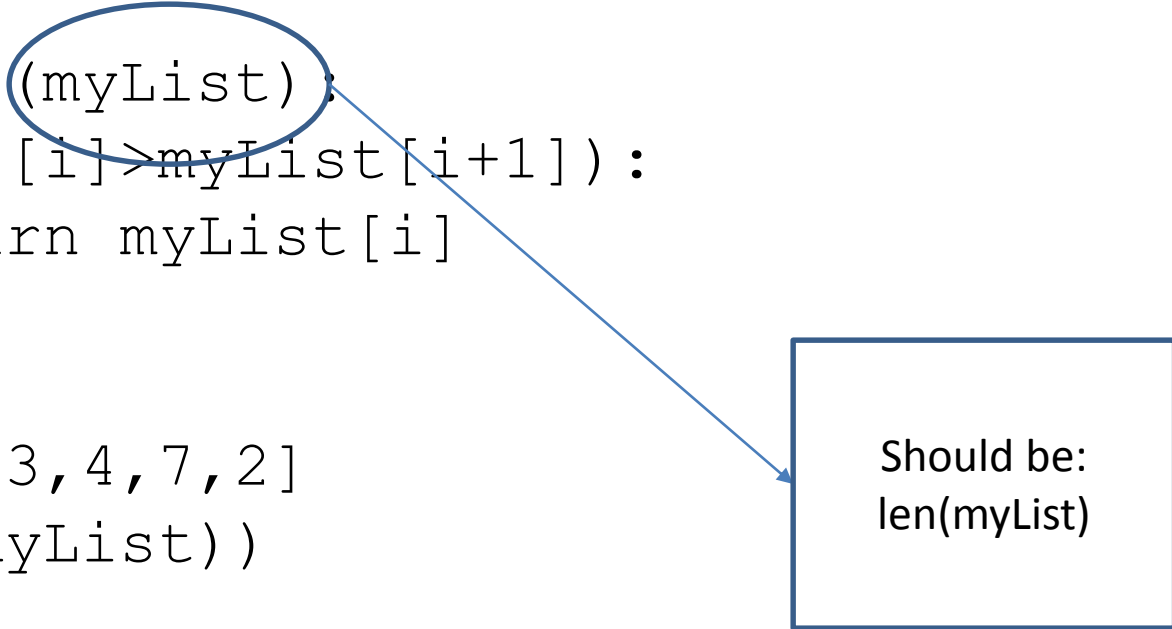

sum and i are
immutable, so the value
of sum will not change
after calling add.

>>0

Find the bug ?!

This program should find the greatest value in a list:

```
def getMax(myList):  
    max = 0  
    for i in range(myList):  
        if(myList[i]>myList[i+1]):  
            return myList[i]  
  
def main():  
    myList = [1,5,3,4,7,2]  
    print(getMax(myList))  
main()
```

Should be:
len(myList)

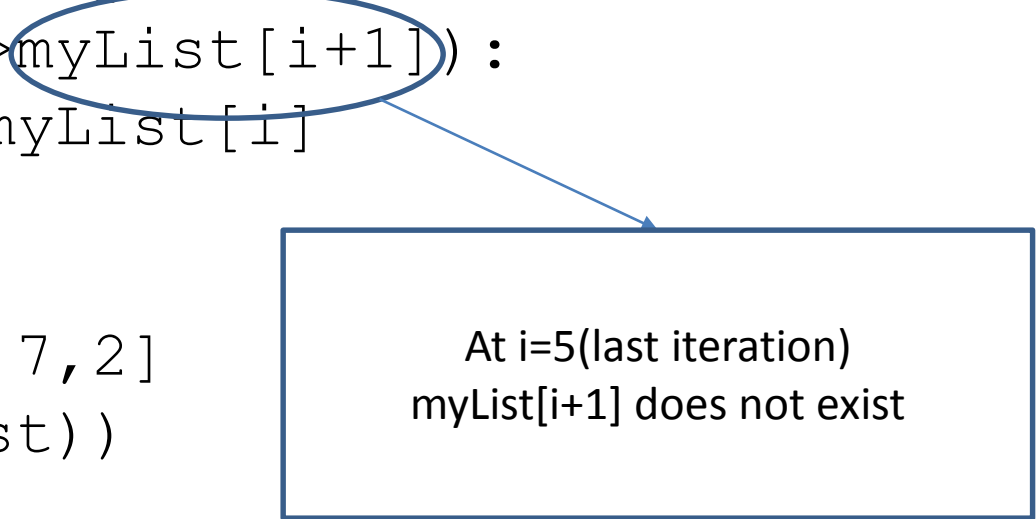

```
>>TypeError: 'list' object cannot be  
interpreted as an integer
```

Find the bug ?!

This program should find the greatest value in a list:

```
def getMax(myList):  
    max = 0  
    for i in range(len(myList)):  
        if (myList[i] > myList[i+1]):  
            return myList[i]
```

```
def main():  
    myList = [1, 5, 3, 4, 7, 2]  
    print(getMax(myList))  
main()
```

At i=5 (last iteration)
myList[i+1] does not exist

```
>>IndexError: list index out of  
range
```

Find the bug ?!

This program should find the greatest value in a list:

```
def getMax(myList):
    max=0
    for i in range(len(myList)):
        if(myList[i]>max):
            max = myList[i]
    return max

def main():
    myList = [1,5,3,4,7,2]
    print(getMax(myList))
main()
```

NO BUG, for positive numbers !

Are there tools to help us find
bugs?

Print Statements and Python
Debugger

Print Statements

- Strategically places `print()` statements can be placed in the source code to verify values
- Advantage: Using print statements (or equivalents) to debug works in every language, no language specific tool must be learned
- Disadvantage: Not everything is printable

Using Print Statements

- Verfiy input and output

```
def sort3(x, y, z):  
    print("Input: x=", x, "y=", y, "z=", z)  
    r = sorted([x, y, z])  
    print("Output:", r)
```

```
>>> sort3(8, 11, 3)  
Input: x= 8 y= 11 z= 3  
Output: [3, 8, 11]
```

Using Print Statements

- Print intermediate live values

```
def t():  
    s = 0  
    for i in range(3):  
        ns = s + i  
        print(ns, "=", s, "+", i)  
        s = ns
```

```
>>> t()  
0 = 0 + 0  
1 = 0 + 1  
3 = 1 + 2
```

Python Debugger

- Many programming languages have debuggers available
- A debugger lets you analyze the program state after each statement
 - Called stepping

Python Debugger

- To launch the Python debugger from IDLE:
 - From the IDLE command window choose the menu: Debug->Debugger
 - Your command window will show [DEBUG ON]
 - Then run commands as normal and you should see the debugger window...

Python Debugger

- Options
 - Stack: Current running function
 - Source: Show me in the source what statement is currently running
 - Locals: What are the values of the local variables
 - Global: What are the values of global variables

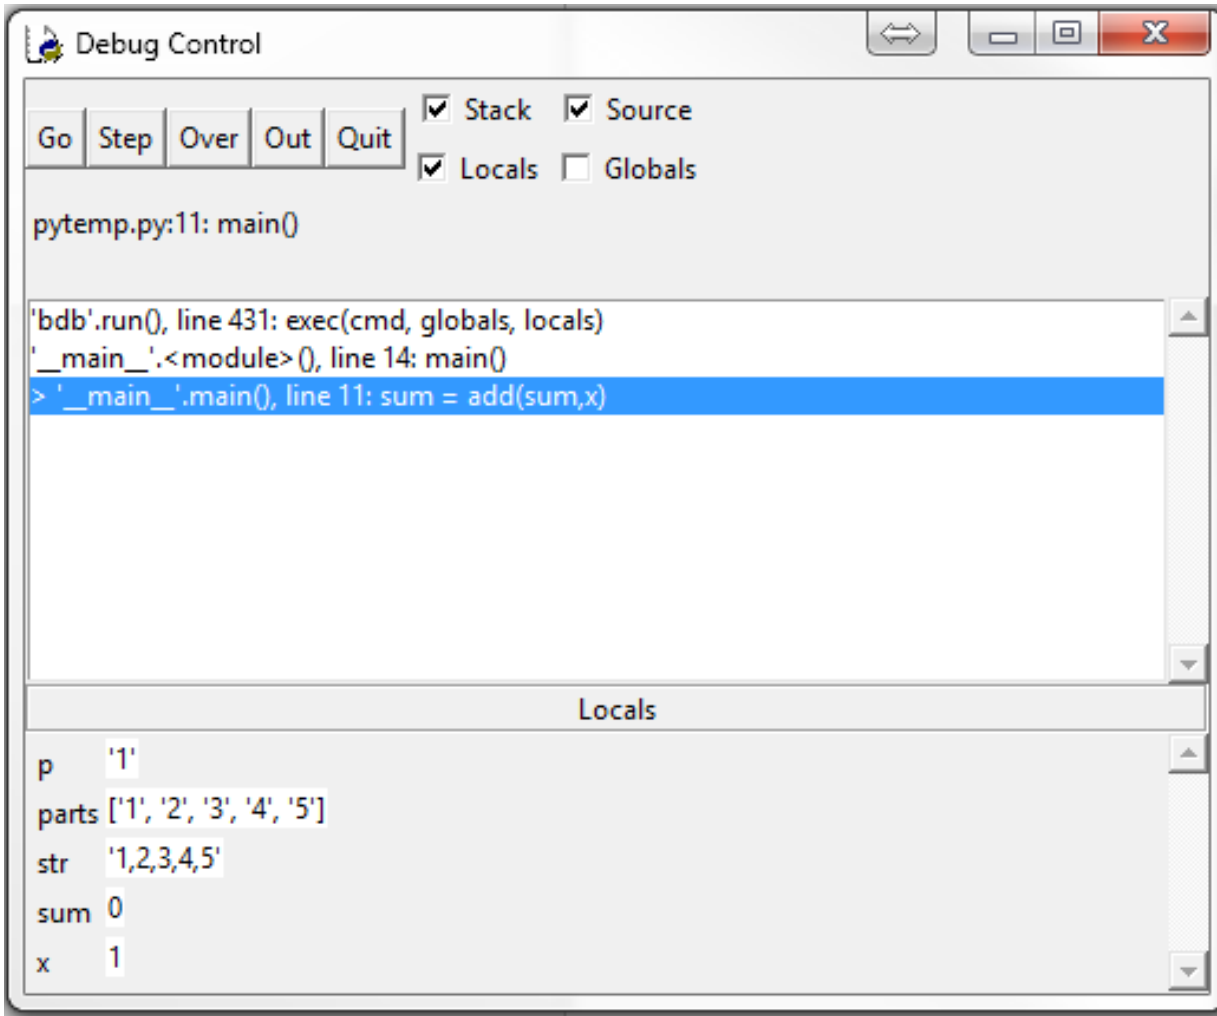

Python Debugger

Debugging this code

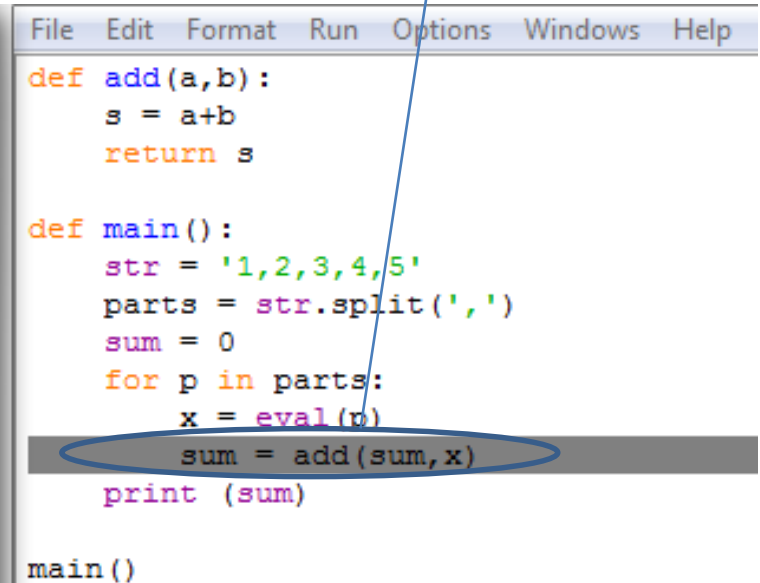

```
def add(a,b):  
    s = a+b  
    return s  
  
def main():  
    str = '1,2,3,4,5'  
    parts = str.split(',')  
    sum = 0  
    for p in parts:  
        x = eval(p)  
        sum = add(sum,x)  
    print (sum)  
  
main()
```

IDLE Debugger

The next line to be executed

The screenshot shows the IDLE Debugger interface. The top window is titled "Debug Control" and contains a toolbar with buttons for "Go", "Step", "Over", "Out", and "Quit". Below the toolbar are checkboxes for "Stack", "Source", "Locals", and "Globals". The main area displays the current execution state: "pytemp.py:11: main()". Below this, a stack trace shows the current frame: "> '._main_'.main(), line 11: sum = add(sum,x)". The bottom window is titled "Locals" and displays the current state of local variables: "p '1'", "parts ['1', '2', '3', '4', '5']", "str '1,2,3,4,5'", "sum 0", and "x 1".

The screenshot shows the IDLE code editor with a menu bar (File, Edit, Format, Run, Options, Windows, Help) and a Python script. The code is as follows:

```
def add(a,b):  
    s = a+b  
    return s  
  
def main():  
    str = '1,2,3,4,5'  
    parts = str.split(',')  
    sum = 0  
    for p in parts:  
        x = eval(p)  
        sum = add(sum,x)  
    print (sum)
```

The line `sum = add(sum,x)` is highlighted in grey, and a blue oval is drawn around it. A blue arrow points from a text box above to this line. Below the code, the text `main()` is visible.

IDLE Debugger

        x = eval(p)
        sum = add(sum,x)
    print (sum)

main()
```

Current values of local variables before the execution of the gray line.

Finish the execution of the program

IDLE Debugger

The screenshot displays the IDLE Python IDE interface. On the left, the 'Debug Control' window is open, showing the execution stack and local variables. The 'Go' button is circled in blue, and an arrow points from a text box above to it. The execution stack shows the current line of code being executed: `> '_main_.main(), line 11: sum = add(sum,x)`. The local variables section shows the following values:

| Variable | Value |
|----------|---------------------------|
| p | '1' |
| parts | ['1', '2', '3', '4', '5'] |
| str | '1,2,3,4,5' |
| sum | 0 |
| x | 1 |

On the right, the Python script is displayed with the following code:

```
File Edit Format Run Options Windows Help
def add(a,b):
    s = a+b
    return s

def main():
    str = '1,2,3,4,5'
    parts = str.split(',')
    sum = 0
    for p in parts:
        x = eval(p)
        sum = add(sum,x)
    print (sum)

main()
```

Step into. If the next line is a function call, step into will go to this function and walk through its execution line by line

IDLE Debugger

Debug Control

Go Step Over Out Quit Stack Source Locals Globals

pytemp.py:2: add()

'bdb'.run(), line 431: exec(cmd, globals, locals)
'_main_'.<module>(), line 14: main()
'_main_'.main(), line 11: sum = add(sum,x)
> '_main_'.add(), line 2: s = a+b

Locals

a 0
b 1

After stepping out, the flow returned to the main, to continue execution what comes after the function call.

IDLE Debugger

The screenshot displays the IDLE Python IDE's debugger interface. On the left, the 'Debug Control' window shows the current execution state: 'pytemp.py:9: main()'. The stack trace indicates the current frame is '> __main__.main(), line 9: for p in parts:'. The 'Locals' pane shows the following variables and their values:

| Variable | Value |
|----------|---------------------------|
| p | '1' |
| parts | ['1', '2', '3', '4', '5'] |
| str | '1,2,3,4,5' |
| sum | 1 |
| x | 1 |

On the right, the code editor shows the following Python code:

```
def add(a,b):  
    s = a+b  
    return s  
  
def main():  
    str = '1,2,3,4,5'  
    parts = str.split(',')  
    sum = 0  
    for p in parts:  
        x = eval(p)  
        sum = add(sum,x)  
    print (sum)  
  
main()
```

The line 'for p in parts:' is highlighted in the code editor, and a blue arrow points from the 'IDLE Debugger' title to this line. The 'Debug Control' window also has a 'Step out' button highlighted, indicating the current action being performed.

Step over the next line (execute it without going into its details). If the next line is a function call, step over will execute the function without walking through its lines of code.

IDLE Debugger

Debug Control

Go Step **Over** Out Quit

Stack Source
 Locals Globals

pytemp.py:11: main()

'bdb'.run(), line 431: exec(cmd, globals, locals)
'__main__'.<module>, line 14: main()
> '__main__'.main(), line 11: sum = add(sum,x)

Locals

p '1'
parts ['1', '2', '3', '4', '5']
str '1,2,3,4,5'
sum 0
x 1

File Edit Format Run Options Windows Help

```
def add(a,b):  
    s = a+b  
    return s  
  
def main():  
    str = '1,2,3,4,5'  
    parts = str.split(',')  
    sum = 0  
    for p in parts:  
        x = eval(p)  
        sum = add(sum,x)  
    print (sum)  
  
main()
```

Step over executed the function without walking through its lines, and continue the execution of the program.

IDLE Debugger

The screenshot displays the IDLE Python IDE's debugger interface. On the left, the 'Debug Control' window is open, showing the current execution state. The 'Stack' and 'Locals' checkboxes are checked. The current execution state is shown as 'pytemp.py:9: main()'. The stack trace includes: 'bdb'.run(), line 431: exec(cmd, globals, locals); '__main__'.<module>(), line 14: main(); and the current line: '> __main__.main(), line 9: for p in parts:'. The 'Locals' window shows the following variables: p: '1', parts: ['1', '2', '3', '4', '5'], str: '1,2,3,4,5', sum: 1, and x: 1.

On the right, the code editor shows the following code:

```
File Edit Format Run Options Windows Help
def add(a,b):
    s = a+b
    return s

def main():
    str = '1,2,3,4,5'
    parts = str.split(',')
    sum = 0
    for p in parts:
        x = eval(p)
        sum = add(sum,x)
    print (sum)

main()
```

The line 'for p in parts:' is highlighted in blue, indicating the current execution point. A blue arrow points from the text 'Step over executed the function without walking through its lines, and continue the execution of the program.' to the 'Step over' button in the 'Debug Control' window.

ANY QUESTIONS?
